

Viewpoint 5.8 has multiple improvements in VAR module. Below is a short description of what's coming.

Main VAR form has been changed to match the rest of the application and provide better visibility of data and options.

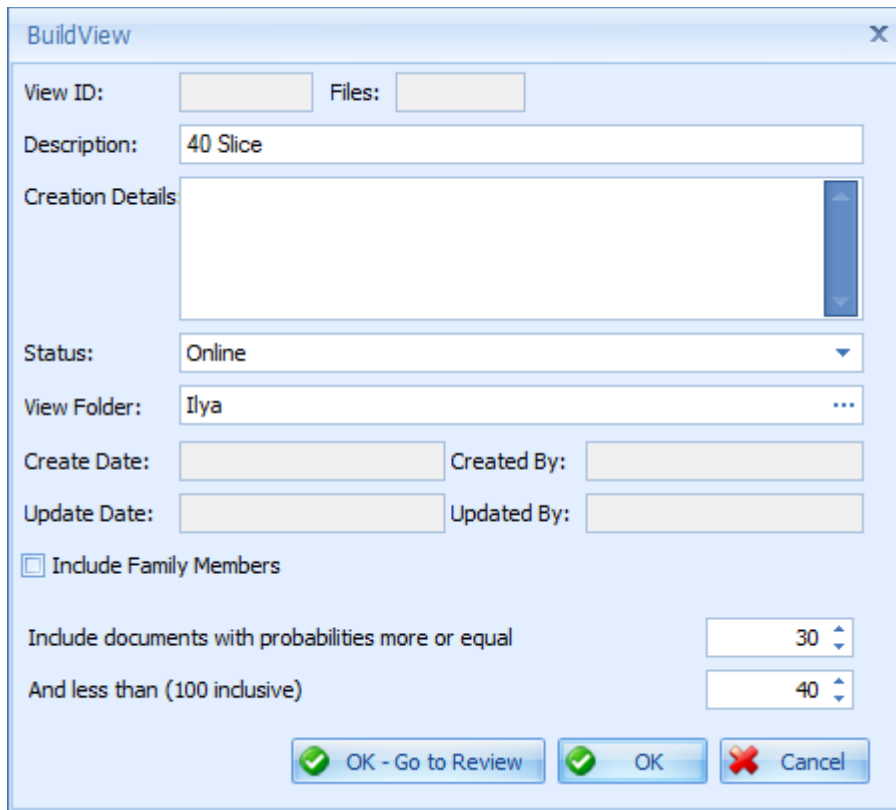

User can have multiple sets of Assistant Review workflows, applied to the same target view and choose one he likes to be visible in Review module as probability calculation results.

Assistant Review Sets						
	Set ID	Description	Model	Target View	Source	Public
	1	Petros	Model Petros	Petros Email HDD-2GE1LD58 - After Dedupe (1)	Petros Email H...	☐
	34	Demo 2	Imported	Unknown Domain (237)		☒
	35	Seed View Based	See View Model	Unknown Domain (237)		☐

When calculations are run, in addition to target view VAR will calculate results for sample and seed views (when available), so user can switch between different views in same set.

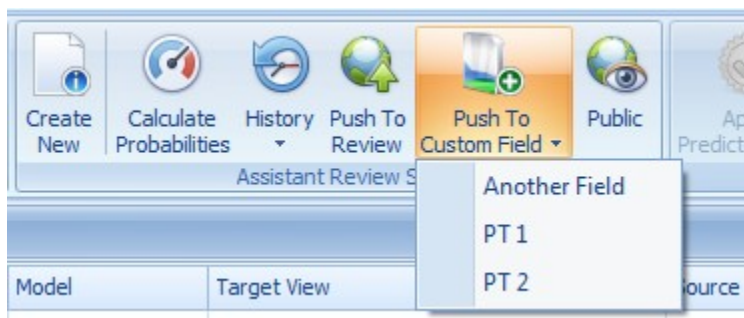

Documents				
View				
Sample View: Sample View (403)				
	Doc ID	Predicted Tag	Ext	
	☐			
	☐ 169	Not Marked		MSG
	☐ 171	Not Marked		MSG
	☐ 206	Not Marked		MSG
	☐ 246	Not Marked		doc
	☐ 279	Not Marked		doc
	☐ ...	...		MSG

Ability to build view from results by specifying probability range

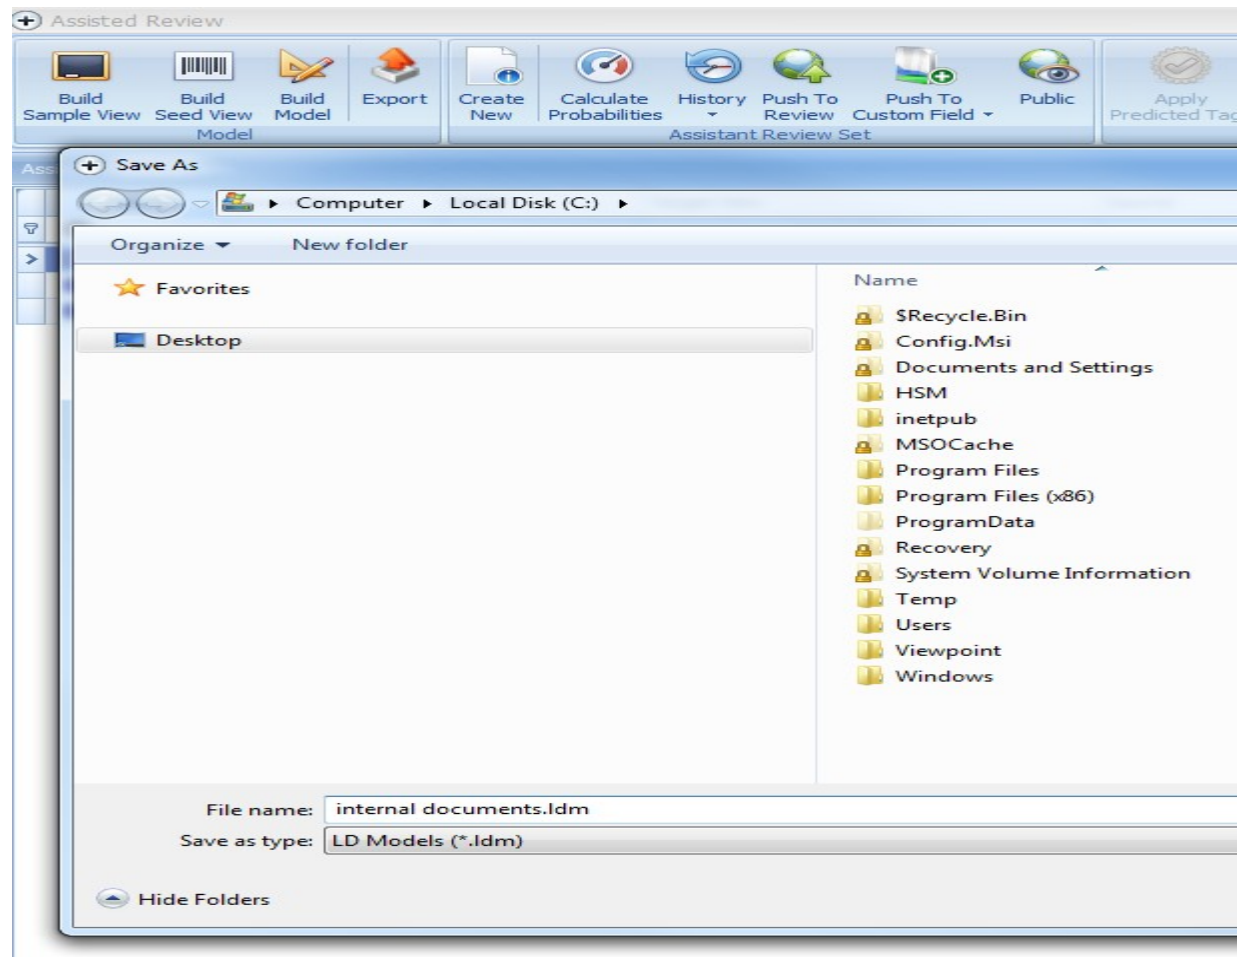

The BuildView dialog box is used for configuring a view. It includes fields for View ID, Files, Description (set to '40 Slice'), Creation Details, Status (set to 'Online'), View Folder (set to 'Ilya'), Create Date, Created By, Update Date, and Updated By. There is a checkbox for 'Include Family Members' and two numeric input fields for probability ranges: 'Include documents with probabilities more or equal' (set to 30) and 'And less than (100 inclusive)' (set to 40). At the bottom are three buttons: 'OK - Go to Review', 'OK', and 'Cancel'.

User can publish results of the calculation to custom field of his choice, if there is a need to see calculations from different sets for same document at once.

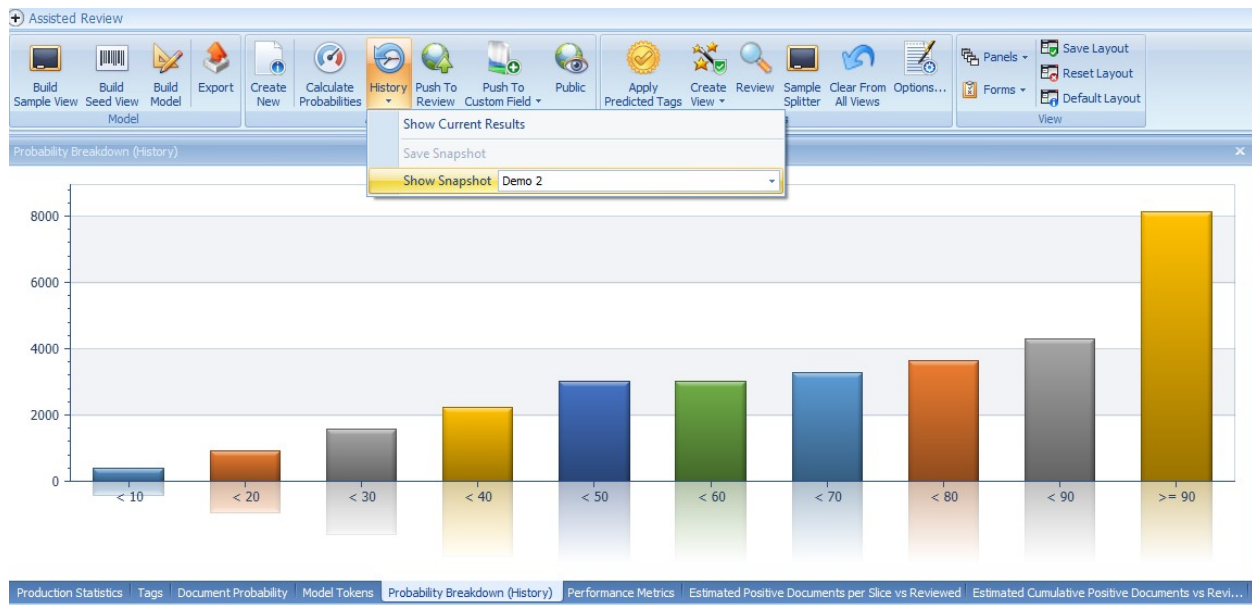

Model can be exported into the file and imported to another project.

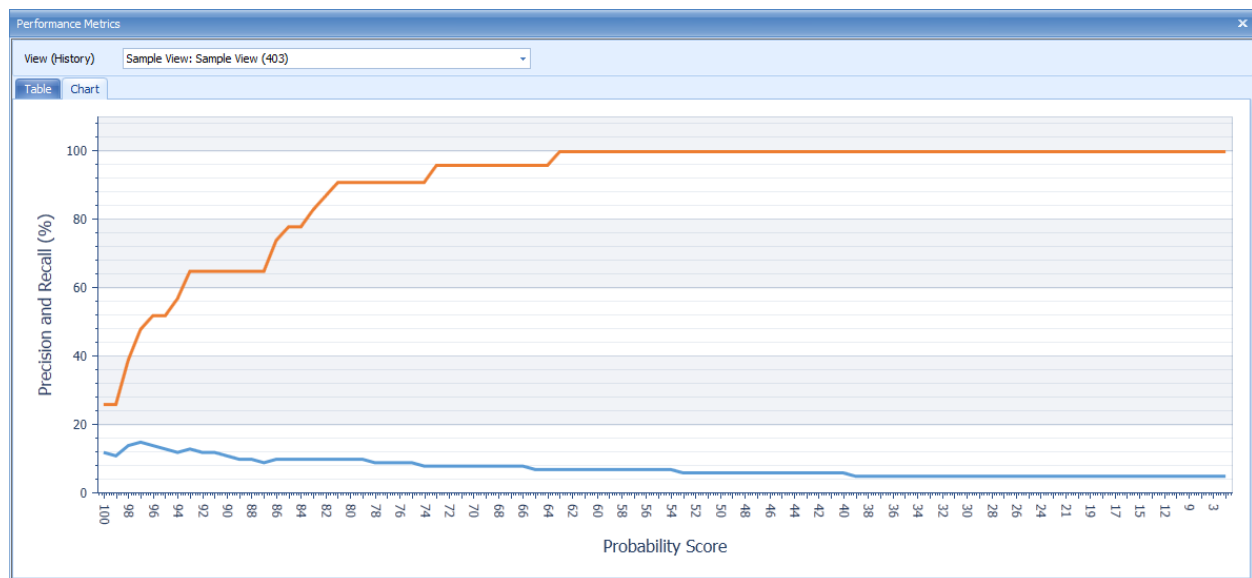

Calculation results can be saved as snapshot to keep history.
