

Viewpoint Enhanced Review - Dataflow

How an Enhanced Review job moves from the Viewpoint UI, through the processing queue and worker pool, out to the GCP Gemini Enterprise agent platform, and back to the reviewer.

Key points

- **Enhanced Review** creates a processing request and writes it to the Processing DB as a queued job.
- For each job the Worker calls the **GCP Gemini Enterprise** agent platform over HTTPS, authenticating with an API service key.
- The **Gemini Enterprise** agent platform does **not store** any submitted data.
- Enhanced Review **reads** from the Review DB to populate the reviewer UI.
- Only the Gemini Enterprise endpoint sits **outside** the Conduent boundary.
- The **Worker** polls the Processing DB and claims queued jobs for execution.
- Large documents may generate **more than one** agent request per job.
- Agent responses are written by the Worker to the **Review DB**.
- Processing and Review are **separate databases** - a job queue and a results store.
